

CMPE2600 Lab 6 – Chem Plant - Reverse Functionality

Name: _____

Introduction

This project has multiple phases. All phases relate to designing and implementing a PLC program to control a chemical process. The actual plant uses 4 tanks: 2 chemical storage tanks, a mixing tank to heat and stir the two chemicals before dumping them to a holding tank. You will be programming the controller for a simulator that has a mixing tank and a reservoir representing the source tanks for the two chemicals and the holding tank.

System Description (effectively the Problem Statement)

If the Start button is pressed the system enters Normal mode which operates as follows:

- In this lab we continue from the last lab but add a reverse SW12. Pressing SW12 (Reverse) causes the plant to mix for 2 seconds. Then fill to 20 cm and then drain.
- Then it will mix for 3 seconds and fill to 30cm and finally drain.
- You must still show the height in cm while filling and the height in EU's while draining.
